## Eden-Staudacher approach

Anomalous dimension at large  $j$

$$\gamma = 8 g^2 \sigma(0) \ln j = 4 g \sqrt{2} f(0) \ln j$$

$$\sigma(t) = \epsilon f(x) , \quad t = \epsilon x , \quad \epsilon = \frac{1}{g \sqrt{2}} ,$$

Eden-Staudacher equation

$$\epsilon f(x) = \frac{t}{e^t - 1} \left( \frac{J_1(x)}{x} - \int_0^\infty dx' K(x, x') f(x') \right) ,$$

$$K(x, y) = \frac{J_1(x) J_0(y) - J_1(y) J_0(x)}{x - y} .$$

Mellin transformation

$$f(x) = \int_{-i\infty}^{i\infty} \frac{d j}{2\pi i} e^{x j} \phi(j) .$$

Ansatz for the solution

$$\phi(j) = \sum_{n=1}^{\infty} \phi_{n,\epsilon}(j) (\delta_{n,1} - a_{n,\epsilon}) ,$$

$$\phi_{n,\epsilon}(j) = \sum_{s=1}^{\infty} \frac{\left( \sqrt{(j + s\epsilon)^2 + 1} + j + s\epsilon \right)^{-n}}{\sqrt{(j + s\epsilon)^2 + 1}}$$

## Analytic properties of solutions

### Linear set of equations

$$a_{n,\epsilon} = \sum_{n'=1}^{\infty} K_{n,n'}(\epsilon) (\delta_{n',1} - a_{n',\epsilon}) ,$$

### Kernel

$$K_{n,n'}(\epsilon) = 2n \sum_{R=0}^{\infty} (-1)^R \frac{2^{-2R-n-n'}}{\epsilon^{2R+n+n'}}$$

$$\zeta(2R + n + n') \frac{(2R + n + n' - 1)! (2R + n + n')!}{R! (R + n)! (R + n')! (R + n + n')!}$$

### Transcedentality with integer coefficients

$$\gamma(\epsilon) = 8 \sum_{k=1}^{\infty} \left( -\frac{1}{4\epsilon^2} \right)^k \sum_{[s_t]} c_{[s_t]} \prod_r \zeta(s_r), \quad \sum_t s_t = 2k-2$$

### Dispersion representation for solution

$$\xi(z) = \int_L \frac{dz'}{2\pi i} \frac{\xi(z') - \xi(-1/z')}{z - z'}, \quad z = j + \sqrt{j^2 + 1},$$

$$\frac{\xi(z) - \xi(-1/z)}{2\sqrt{j^2 + 1}} = 1 - \sum_{s=1}^{\infty} \frac{\xi \left( j + s\epsilon + \sqrt{(j + s\epsilon)^2 + 1} \right)}{\sqrt{(j + s\epsilon)^2 + 1}}$$

Pomeron and graviton at  $N = 4$  SUSY (OKLV)

BFKL Pomeron in a diffusion approximation

$$j = 2 - \Delta - D \nu^2$$

Anomalous dimension of twist-2 operators

$$\gamma = 1 + \frac{j - 2}{2} + i\nu$$

Constraint from the conservation of  $T_{\mu\nu}$

$$\gamma = (j - 2) \left( \frac{1}{2} - \frac{1/\Delta}{1 + \sqrt{1 + (j - 2)/\Delta}} \right)$$

AdS/CFT for the graviton Regge trajectory

$$j = 2 + \frac{\alpha'}{2} t, \quad t = E^2/R^2, \quad \alpha' = \frac{R^2}{2} \Delta$$

Large coupling asymptotics

$$\gamma_{|z \rightarrow \infty} = -\sqrt{j - 2} \Delta_{|j \rightarrow \infty}^{-1/2} = \sqrt{\pi j} z^{1/4}$$

Pomeron intercept at large  $\alpha$  and its perturbative estimate

$$j = 2 - \Delta, \quad \Delta = \frac{1}{\pi} z^{-1/2} \approx \frac{\sqrt{3}}{2\pi} z^{-1/2}$$

## Resummation of the DGLAP and BFKL equations

Slope of the anomalous dimension

$$\gamma'(2) = \frac{1}{2} - \frac{1}{2\Delta} = -\frac{\pi^2}{6}z + \frac{\pi^4}{72}z^2 - \frac{\pi^6}{540}z^3 + \dots$$

Resummation equation

$$\frac{\pi^2}{6}z = -\tilde{b} + \frac{1}{2}\tilde{b}^2, \quad b = \gamma'(2)$$

Weak and strong coupling asymptotics

$$\tilde{b} = -\frac{\pi^2}{6}z + \frac{\pi^4}{72}z^2 - \frac{\pi^6}{432}z^3 + \dots, \quad \tilde{\Delta} = \frac{\sqrt{3}}{2\pi}z^{-1/2}$$

Two-loop BFKL results

$$\omega_0 = 1 - \Delta = 4 \ln 2 z - a_1 z^2 + \dots$$

$$D = 14 \zeta(3) z - b_1 z^2 + \dots, \quad \zeta(3) = \sum_{n=1}^{\infty} \frac{1}{n^3}$$

Resummation for large couplings

$$4 \ln 2 z = \frac{(1 - \Delta) - (2 - a_1 (4 \ln 2)^{-2}) (1 - \Delta)^2}{\Delta^2}$$

$$14 \zeta(3) z = \frac{1 - \sqrt{1 - 2 D^3 + c D^4}}{D^2}$$
